

GROUP 3.2 PSEUDO CODE

Pseudo code

Start

1. Display "GENERATOR FUEL CONSUMPTION ESTIMATOR SYSTEM"
2. Declare a list/array to store generator records
3. Prompt user to enter number of generator records
4. While number of records is less than or equal to 0
 - #Display "Invalid input! Number of records must be greater than zero"
 - #Prompt user again for number of records
5. Open file "generator_fuel_report.txt" for writing
6. Write system heading into the file

For each generator record

7. For counter = 1 to number of records
 - a. Display "Record counter"
 - b. Input generator ID
 - c. Prompt user for generator rating in kVA
 - #While rating ≤ 0
 - ◆ Display error message
 - ◆ Prompt again
 - d. Prompt user for running hours
 - #While running hours ≤ 0
 - ◆ Display error message
 - ◆ Prompt again
 - e. Prompt user for fuel consumption rate (litres per hour)
 - #While fuel rate ≤ 0
 - ◆ Display error message
 - ◆ Prompt again
 - f. Prompt user for fuel price per litre
 - #While fuel price ≤ 0
 - ◆ Display error message
 - ◆ Prompt again

Processing

g. Calculate fuel consumed
fuelConsumed = fuelRate x running hour

h. Calculate fuel cost
fuel Cost = fuel Consumed x fuel price

i. Determine usage status

- If fuelConsumed $\leq$ 10
 - usageStatus = "Low Fuel Usage"
- Else if fuelConsumed $\leq$ 30
 - usageStatus = "Moderate Fuel Usage"
- Else
 - usageStatus = "High Fuel Usage"

Display output

j. Display:

- Fuel Consumed
- Estimated Fuel Cost
- Usage Status

Save output to file

k. Write the following to generator_fuel_report.txt

- Generator ID
- Generator Rating
- Running Hours
- Fuel Consumption Rate
- Fuel Price
- Fuel Consumed
- Estimated Fuel Cost
- Usage Status
- Separator line

8.End For loop

Finish

9.Close the file

10.Display "Report saved successfully to generator_fuel_report.txt"

11. Stop
